NIE_BMAP_MS2 library is a subtracted library derived from NIE_BMAP_MS2 library is a subtracted library derived from a mixture of normalized libraries from ten
regions of the mouse brain (cerebellum, brain stems,
olfactory bulbs, hypothalams, contex, amygdala, basal
ganglia, pineal gland, striatum, hipocrampus). The driver
used for subtraction consisted of a pool of 5,000 clones
obtained from non-normalized and normalized mouse brain
spinal cord libraries.
TAG_ILB=NIE_BMAP_MS1 library and a pool of 2,000 clones
obtained cord libraries.
TAG_ILB=NIE_BMAP_MS1 library and a pool of 2,000 clones
of the most purp libraries.

The sequence tag present in the cons between the Nori site and the oligo-dr track served to identify it as a clone from the normalized olfactory bulbs library cDNs inhary Preparation: M.B. Soares tab Clone distribution: NIH BMAP cDNR clones will be made available by the means that is soon to be determined. When NIH record will be updated accordingly when that means is determined accordingly when that means is determined.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AW049121

```
This sequence is a fragment of the plasmid pINCY which is used in a method to detect the presence of a target human cS198 polymothcotide in a test sample. The CS198 gene is useful as a marker for gastrointestinal (GI) tract disorders. The methods and products can be used in detecting, diagnosing, staging, monitoring, prognostleating, preventing or treating, or determining the predisposition to diseases and conditions of the GI tract, such as I tract cancer, Barret's oesophagus, gastric ulcer, gastritis, leiomyoma, polyps, Crohn's disease, ulcerative colitis, and pancreatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 68 BP; 13 A; 20 C; 21 G; 14 T; 0 other;

                                                                                                                                 The present sequence appears in the specification, which describes a set of contiguous and partially overlapping EST sequences designated CS141. The sequences are isolated from a cDNA library made from gastrointestinal tract tumour and normal tissues. The CS141 gene is useful as a marker for gastrointestinal tract disorders. The methods and products can be used in detecting, diagnosing, staging, monitoring, promosticating, preventing, or determining the predisposition to diseases and conditions of the gastrointestinal tract, such as gastrointestinal tract cancers, Marret's esophagus, gastric ulcer, gastritis leiomyoma, polyps, Crohn's disease, ulcerative colitis,

ö
a set of contiguous and partially overlapping EST sequences designated (S110. The sequences are isolated from a colmA library made from gastrointestinal tract tumour and normal tissues. The polypeptides are useful diagnostically to detect CS110 antign/anti-CS110 antibody in samples, e.g. to detect diseases and conditions of the gastrointestinal tract, especially cancers, e.g. adenocarchoma and lymphoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 AGCTCGGBAFTCCGAGCTTGGATCCTCTAGAGCGGCCGCCGACTAGTGAGCTCGTCGACC 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel contiguous and partially overlapping cDNA sequences and their encoded polypeptides, designated PALS3, transcribed from human pancatic tissue and which have cytostatic activity. The PALS3 polymuclectides, proteins and antibodies are all useful in methods of detection. Detection of PALS3 polymuclectide, antipodies in a sample is indicative of pancratic disease. PALS3 antibodies (antagonists) can also be used in vivo for therapeutic use, e.g. treatment of pancraciic disease, tumnours of metastases. Antisease PALS3 polymuclectides can be used in quentastases. Antisease PALS3 polymuclectides can be used in generation of the pancraciic disease. This sequence represents a pINCX primer than the part of the pancraciic diseases.

This invention describes novel human BS274 protein clones which can be used as markers for breast cancer and have antitumour activity. BS274 can also be used as a marker of cancer and its metastases, atypical hyperplasia, fibroadenoma and cysts, so detection/quantification of BS274 encoded polypeptides and BS274-specific antifiodises are used as FA274-specific antifiodises are useful contractions of the diagnosis, staging, monitoring, prognosis, in vivo imaging of, and determining predisposition to these diseases. Antibodises are useful as immunosasy reagents and in competitive drug screens. BS274 nucleic acid and its fragments, are used as probes and primers (in diagnostic assays, for quantifying gene expression, for detecting chromosomal anomalies and the reapoutic antisense, intplex-forming and ribozyme sequences, and for recombinant production of BS274 polypeptides. BS274 polypeptides are used as immunosasay reagents, for generating antibodies, in drug screens used as immunosasay reagents, for generating antibodies, in drug screens cas deal as therapeutic agents) and for rational drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

```
The sequence is that of a pINCY polylinker fragment which was used in the construction of an expression vector for a BS124-specific EST clone. Such a clone is useful for detecting, diagnosing, staging, preventing or treating, or determining predisposition to diseases or conditions of the breast, such as breast cancer.
                                                                                                                                                                                                                                                                                                                                     New isolated BS124 polynucleotides and polypeptides - used for detecting, diagnosing, preventing or treating diseases or conditions of the breast, such as breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 AGCTCGGAATTCCGAGCTTGGATCCTCTAGAGCGGCCGCCGACTAGTGAGCTCGTCGACC 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel human breast-specific protein BS200. This protein and its encoding nucleic acids are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining predisposition to diseases or conditions of the breast, such as breast cancer.

(see AAA64845 and AAA64846). The present invention relates to a multimeric polypeptide antipen, which comprises of the mammaglobhin and BUJOI proteins. The presence of multimeric polypeptide antigen in a test sample can be used as the basis for a test to diagnose breast disease e.g. breast cancer, in a patient. The detection can be carried out using antibodies specific for the multimeric polypeptide antigen. The present sequence is a synthetic polylinker used in the construction of plasmid pINGY. PINCY was used to clone the coding sequences of mammaglobin and BUJOI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate concer. They can also be used to produce antibodies Which can be used in treatment. The present sequence is one of the PS108 partial coding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; prostate cancer; PS108; antibody; tumour; metastasis; vector; ds.

                                                                                                                                                                                                                                                            The present sequence appears in the specification, which describes an enthod for detecting the presence of a target PS108 polymuclectide in a test sample. The method comprises contacting the test sample with at least 1 PS108-specific polymuclacitied or complement, and detecting the presence of the target PS108 polymuclacitie. The products can be used for detecting, diagnosing, staging, anitoring, prognosticating, in vivo imaging, preventing or treating, or determining predisposition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostatitis, prostatic intraphibalial neoplasia (PTM) and cancer. In particular the products can be used in drug screening and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic polylinker sequence # 1 used in plasmid pINCY construction.

This sequence was used to isolate B3325 coding sequence clones. The invention relates to a method of detecting the presence of a target B3325 propuclectide in a test sample comprises: (a) contacting the test sample comprises: (a) contacting the test sample contacting the test sample and (b) detecting the presence of B3325 polynuclectide or complement thereof; and (b) detecting the presence of B3325 polynuclectide from the test sample. The method is used to enable the identification of certain markers as indicative of a breast tissue disease or condition. The methods can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing, or treating conditions associated with B332, especially breast cancer. The B3325 polypeptides can be used to raise antibodies, and to identify agonists and antipodies. The B3325 polypuclectides are used as a source of probes and primers. The invention provides an alternative, non-surgical diagnostic methods which are capable of detecting early stage breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel methods for the detecting the presence of target B8325 obtypeptides and polymucleotides, used for identifying and monitoring diseases of the breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 AGCICGGAAIICCGAGCIIGGAICCICIAGAGCGGCCGCCGACIAGIGAGCICGICGACC 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is an oligonucleotide used during the production of an expression vector containing the coding sequence for the human prostate cancer-induced growth factor (PCIGF). The protein is a member of the TGF-beta superfamily. The 3' part of the gene has been shown to be upregulated in prostate cancer, and thus can be used in the diagnosis of the disasse. It is also useful for the identification of antagnosis of the PCIGF protein which can be used to treat cancer. In addition, benign neoplasia can be detected using the gene and protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, TGF-beta superfamily; prostate cancer-induced growth factor;

The invention relates to a method of detecting the presence of a target CS 198 polynucleotide. The method is useful for least one CS 198 specific polynucleotide. The method is useful for detecting diseases of the gastrointestinal (GI) tract organs.

Getecting diseases of the gastrointestinal (GI) tract organs.

CG particularly cancer. The CS 198 polynucleotides, polypeptides and conditions of the GI tract such as cancer, quastric ulcer, gastritis, Crohn's disease, ulcerative colitis, pancreatitis and parret's esophagus. The CS 198 polypeptides are useful as cancer, gastritis, con's disease, ulcerative colitis, pancreatitis and parret's esophagus. The CS 198 polypeptides are useful as standards or respents in diagnostic immunoassays, as components or as target sites for various therapies. Antibodies directed against at carget sites for various therapies. Antibodies directed against at carget sites for various therapeutic agents, in diagnostic tests and for creening for conditions or diseases associated with CS 198, creening for conditions or diseases associated with CS 198, creening. The method of the invention provides an alternative, non-surgical diagnostic method capable of detecting early stage GI tract disease such as cancer. The present sequence is a synthetic DNA fragment cused for CS 198 for 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ouery Match 100.0%; Score 68; DB 22; Length 68; Best Local Similarity 100.0%; Pred, No. 1.1e-15; Matches 68; Conservative 0; Mismatches 0; Indels 0; Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human BS106-specific polypeptides and polyunciacorides. The BS106 polypeptides and antibodies are useful for detecting, diagnossing, staging, monitoring, prognosticating, preventing, treating or determining the predisposition of an individual to diseases and conditions of the breast such as breast ancer. They are also useful in the treatment of tumours or metastases. Polymouleachides of the invention are useful in drug screening and gene therapy. The present sequence is a synthetic DNR fragment used to construct pinky plasmid which comprises human BS106 gene oDNA, expressed sequence tag (EST) clone 1662885.

The patent discloses PS-133 polynucleotides and polypeptides which are indicative of prostate disease. The patent also provides a method for detecting PS133 protein in a test sample. The polynucleotides of the invention are useful for detecting, diagnosing, staging, monitoring, preventing, treating or determining the predisposition of an individual to prostate diseases such as cancer. PS133-derived polynucleotides are used for the detection of normal or altered gene expression, in assays for detecting, amplifying or quantifying genes or nucleic acids relating to prostate tissue diseases and conditions, and to produce probes which can be used in the detection of nucleic acids in a sample. PS-133 proteins are used as immunogens for the therapy. The present sequences are also used in gene therapy. The present sequence is a synthetic DNA fragment which is used in the generation of planty plantid comprising PS133 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description
